# NETD Lab5

Hello Everyone, I had an idea from my Lab4 where I created an application where it enter the information of Books like Title, ISBN, Price, Condition, so I decided to work on the same idea and to create more functionality like search, login, register, database into it.

If you want to add a book which you want to display, then first and foremost you have to login or register in order to publish. So that is the high level of privacy as well as security. It doesn't allow you to access website without login other than Home Page.

There's functionality of Edit, to check details and Delete the book which you published.

So basically, if you get to know that your book is worth more than what you actually published than there's edit option where you can edit any information you want, and it will be changed in a fraction of time.

After publishing the book, you can also view the details of the product which will be helpful for customer to get proper details of it.

If you flip your decision on selling the book, then you can delete the product because sometimes you get to know that it is actually worth more and it's a collector's piece than you delete the product and can preserve it.

So, this is the simple ASP.net core MVC application which have high level of integrated security which customers can rely on using it.

PS: It is still a under-construction website which might have more revamps in future which might have good features added to it.
